MATHEMATICS 14–24

PROGRAM RATIONALE AND PHILOSOPHY

The need for and use of mathematics in our daily lives is changing. This necessitates a change in the emphasis of mathematics education. The emphasis has shifted from the memorization of mathematical formulae and algorithms to the use of mathematics to reason, interpret and explore. The focus is on developing students' mathematical knowledge, skills and attitudes through a problem-solving approach. More than ever before, students must become creative and logical thinkers, data managers and problem solvers. They must develop communication skills and be cooperative and interactive to cope with daily life today and tomorrow.

The use of technology is increasing in importance in our society. This is reflected in our mathematics curriculum. The integration of technology into the mathematics classroom allows students to use computers and calculators to provide quick and accurate computation and manipulation, to enhance conceptual understanding, and to facilitate higher order thinking.

Students have to understand how mathematical concepts permeate daily life, business and industry. They have to be given real-world activities and problems so they can make connections between [illegible]ssroom learning and the world in which they [illegible]. Students need to be exposed to varied, [illegible]rrelated experiences that encourage them to understand and appreciate the role of mathematics in our society.

The Mathematics 14–24 program is derived from *The Common Curriculum Framework for K–12 Mathematics: Western Canadian Protocol for Collaboration in Basic Education*, 1995, and *The Common Curriculum Framework for K–12 Mathematics Grade 10 to Grade 12: Western Canadian Protocol for Collaboration in Basic Education*, 1996. Outcomes have been modified as needed. The Mathematics 14–24 sequence is designed for students whose needs, interests and abilities focus on basic mathematical understanding. The emphasis is on the acquisition of practical life skills and proficiency in using mathematics to solve problems, accommodate change, interpret information and create new knowledge within meaningful contexts.

BELIEFS ABOUT STUDENTS AND MATHEMATICS LEARNING

Students must construct their own meaning of mathematics.

Students are curious, active learners who have individual interests, abilities and needs. They come to classrooms with different knowledge, life experiences and backgrounds that generate a range of attitudes about mathematics and life.

MATHEMATICS 14–24

PROGRAM RATIONALE AND PHILOSOPHY

The need for and use of mathematics in our daily lives is changing. This necessitates a change in the emphasis of mathematics education. The emphasis has shifted from the memorization of mathematical formulae and algorithms to the use of mathematics to reason, interpret and explore. The focus is on developing students' mathematical knowledge, skills and attitudes through a problem-solving approach. More than ever before, students must become creative and logical thinkers, data managers and problem solvers. They must develop communication skills and be cooperative and interactive to cope with daily life today and tomorrow.

The use of technology is increasing in importance in our society. This is reflected in our mathematics curriculum. The integration of technology into the mathematics classroom allows students to use computers and calculators to provide quick and accurate computation and manipulation, to enhance conceptual understanding, and to facilitate higher order thinking.

Students have to understand how mathematical concepts permeate daily life, business and industry. They have to be given real-world activities and problems so they can make connections between classroom learning and the world in which they live. Students need to be exposed to varied, interrelated experiences that encourage them to understand and appreciate the role of mathematics in our society.

The Mathematics 14–24 program is derived from *The Common Curriculum Framework for K–12 Mathematics: Western Canadian Protocol for Collaboration in Basic Education*, 1995, and *The Common Curriculum Framework for K–12 Mathematics Grade 10 to Grade 12: Western Canadian Protocol for Collaboration in Basic Education*, 1996. Outcomes have been modified as needed. The Mathematics 14–24 sequence is designed for students whose needs, interests and abilities focus on basic mathematical understanding. The emphasis is on the acquisition of practical life skills and proficiency in using mathematics to solve problems, accommodate change, interpret information and create new knowledge within meaningful contexts.

BELIEFS ABOUT STUDENTS AND MATHEMATICS LEARNING

Students must construct their own meaning of mathematics.

Students are curious, active learners who have individual interests, abilities and needs. They come to classrooms with different knowledge, life experiences and backgrounds that generate a range of attitudes about mathematics and life.

©Alberta Education, Alberta, Canada

Students learn by attaching meaning to what they do; and they must be able to construct their own meaning of mathematics. This meaning is best developed when learners encounter mathematical experiences that proceed from the simple to the complex and from the concrete to the abstract. The use of manipulatives can address the diversity of learning styles and developmental stages of students and can enhance the formation of sound, transferable, mathematical concepts. At all levels, students benefit from working with appropriate materials, tools and contexts when constructing personal meaning about new mathematical ideas. The learning environment should value and respect each student's way of thinking, so that the learner feels comfortable in taking intellectual risks, asking questions and posing conjectures.

Mathematics is a common human activity, increasing in importance in a rapidly advancing, technological society. Proficiency in using mathematics increases the opportunities available to individuals. Students need to become mathematically literate in order to explore problem-solving situations, accommodate changing conditions and actively create new knowledge in striving for self-fulfillment.

GOALS FOR STUDENTS

Mathematics education must prepare students to use mathematics to solve problems.

The main goals of mathematics education are to prepare students to:

- use mathematics confidently to solve problems
- communicate and reason mathematically
- appreciate and value mathematics
- commit themselves to lifelong learning
- become mathematically literate adults, using mathematics to contribute to society.

Positive attitudes toward mathematics are important.

At the completion of a program, students should have developed a positive attitude toward mathematics and have a base of knowledge and skills related to number, patterns and relations, shape and space, and statistics and probability.

It is important for students to develop a positive attitude toward mathematics so that they can become confident in their ability to undertake the problems of a changing world, thereby experiencing the power and usefulness of mathematics. Students also should gain an understanding and appreciation of the contributions of mathematics, as a science and as an art, to civilization and to culture.

Students should:

- exhibit a positive attitude toward mathematics
- engage and persevere in mathematical tasks and projects
- contribute to mathematical discussions
- take risks in performing mathematical tasks
- exhibit curiosity
- show enjoyment of mathematical experiences.

All students should receive a level of mathematics education appropriate to their needs and abilities.

CONCEPTUAL FRAMEWORK FOR K–12 MATHEMATICS

This framework summarizes the philosophical view toward mathematics and mathematics education.

Students of mathematics, regardless of age or experience, strive to do mathematics in settings that are new to them. The conceptual framework outlined in this section presents a multifaceted view of mathematics and presents the discipline as skills, procedures and concepts woven together.

The framework chart below shows how student outcomes, organized by grade and strand, are designed to be influenced by Mathematical Processes and the Nature of Mathematics. These components are described more fully in this section.

MATHEMATICAL PROCESSES – COMMUNICATION, CONNECTIONS, ESTIMATION AND MENTAL MATHEMATICS, PROBLEM SOLVING, REASONING, TECHNOLOGY, VISUALIZATION

©Alberta Education, Alberta, Canada

MATHEMATICAL PROCESSES

There are critical components that students must encounter in a mathematics program in order to achieve the goals of mathematics education and to encourage lifelong learning in mathematics.

- *Communication* [C] – communicate mathematically
- *Connections* [CN] – connect mathematical ideas to other concepts in mathematics, to everyday experiences and to other disciplines
- *Estimation and Mental Mathematics* [E] – use estimation and mental mathematics where appropriate
- *Problem Solving* [PS] – relate and apply new mathematical knowledge through problem solving
- *Reasoning* [R] – reason and justify their thinking
- *Technology* [T] – select and use appropriate technologies as tools to solve problems
- *Visualization* [V] – use visualization to assist in processing information, making connections and solving problems.

This program of studies incorporates these seven interrelated mathematical processes that are intended to permeate teaching and learning.

UNIVERSITY OF ALBERTA

©Alberta Education, Alberta, Canada

Communication

Students must be able to communicate effectively how an answer was obtained.

Students need to communicate mathematical ideas clearly and effectively, orally and in writing.

Communication will help students make connections among different representations of mathematical ideas; namely, "physical, pictorial, graphic, symbolic, verbal and mental representations." (NCTM, p. 26)

NCTM COMMUNICATION STANDARDS

K–4	5–8	9–12
The study of mathematics should include numerous opportunities for communication so that students can:	*The study of mathematics should include opportunities to communicate so that students can:*	*The mathematics curriculum should include the continued development of language and symbolism to communicate mathematical ideas so that all students can:*
• relate physical materials, pictures, and diagrams to mathematical ideas • reflect on and clarify their thinking about mathematical ideas and situations • relate their everyday language to mathematical language and symbols • realize that representing, discussing, reading, writing, and listening to mathematics are a vital part of learning and using mathematics.	• model situations using oral, written, concrete, pictorial, graphical, and algebraic methods • reflect on and clarify their own thinking about mathematical ideas and situations • develop common understandings of mathematical ideas, including the role of definitions • use the skills of reading, listening, and viewing to interpret and evaluate mathematical ideas • discuss mathematical ideas and make conjectures and convincing arguments • appreciate the value of mathematical notation and its role in the development of mathematical ideas.	• reflect upon and clarify their thinking about mathematical ideas and relationships • formulate mathematical definitions and express generalizations discovered through investigations • express mathematical ideas orally and in writing • read written presentations of mathematics with understanding • ask clarifying and extending questions related to mathematics they have read or heard about • appreciate the economy, power, and elegance of mathematical notation and its role in the development of mathematical ideas.
(NCTM, p. 26)	(NCTM, p. 78)	(NCTM, p. 140)

©Alberta Education, Alberta, Canada

Connections

Through connections students should begin to view mathematics as an integrated whole.

Students need numerous and varied experiences in order to appreciate the usefulness of mathematics and, at the same time, to explore connections within mathematics, from mathematics to other disciplines, and from mathematics to their daily experiences. When mathematical ideas are connected to each other through concrete, pictorial and symbolic representations, students begin to view mathematics as an integrated whole.

This integration "allows students to see how one mathematical idea can help them understand others, and it illustrates the subject's usefulness in solving problems, describing and modeling real-world phenomena, and communicating complex thoughts and information in a concise and precise manner." (NCTM, p. 94)

NCTM CONNECTIONS STANDARDS

K–4	5–8	9–12
The study of mathematics should include opportunities to make connections so that students can:	*The mathematics curriculum should include the investigation of mathematical connections so that students can:*	*The mathematics curriculum should include investigation of the connections and interplay among various mathematical topics and their applications so that all students can:*
• link conceptual and procedural knowledge • relate various representations of concepts or procedures to one another • recognize relationships among different topics in mathematics • use mathematics in other curriculum areas • use mathematics in their daily lives.	• see mathematics as an integrated whole • explore problems and describe results using graphical, numerical, physical, algebraic, and verbal mathematical models or representations • use a mathematical idea to further their understanding of other mathematical ideas • apply mathematical thinking and modeling to solve problems that arise in other disciplines, such as art, music, psychology, science, and business • value the role of mathematics in our culture and society.	• recognize equivalent representations of the same concept • relate procedures in one representation to procedures in an equivalent representation • use and value the connections among mathematical topics • use and value the connections between mathematics and other disciplines.
(NCTM, p. 32)	(NCTM, p. 84)	(NCTM, p. 146)

Estimation and Mental Mathematics

Mental mathematics is the cornerstone for estimation.

Students need to know when and how to estimate. The context of a problem helps to determine when it is necessary or desirable to have an exact answer or an estimate of that answer. Problem contexts include number, patterns and relations, shape and space, and statistics and probability. The use of technology increases the emphasis on estimation skills to enable students to determine the reasonableness of computed answers.

A variety of estimation strategies assists students in arriving at quick approximations for exact answers.

Facility with mental mathematics is an important outcome for students. A focus on mental mathematics forces students to think and improve their efficiency and accuracy in calculating, including pencil and paper calculations. Mental mathematics is the cornerstone for estimation and leads to better understanding of number concepts and number operations. (Hope, pp. 161–173)

©Alberta Education, Alberta, Canada

Problem Solving

Problem solving is the focus of mathematics at all grade levels.

"*Problem solving—which includes the ways in which problems are represented, the meanings of the language of mathematics, and the ways in which one conjectures and reasons—must be central to schooling so that students can explore, create, accommodate to changed conditions, and actively create new knowledge over the course of their lives.*" (NCTM, p. 4)

Problem solving is the focus of mathematics at all grade levels. The development of each student's ability to solve problems is essential. Students develop a true understanding of mathematical concepts and procedures when they solve problems in meaningful contexts. Problem solving is to be employed throughout all of mathematics and should be embedded throughout all of the strands.

Problem solving provides an opportunity for students to be active in constructing mathematical meaning, to learn problem-solving strategies, to practise a variety of concepts and skills in a meaningful context, and to communicate mathematical ideas. Most problem-solving situations in the elementary years come from the everyday experiences of the student. Students are able to attach mathematical meaning to familiar activities. As they progress through school, the problems become more complex. The problems will arise from an exploration of mathematics itself, as well as from the world around them. Gradually, students become more confident in their ability to use and communicate mathematics, using correct terminology.

As students develop mathematically, they are able to solve more challenging problems on an increasing variety of topics. Students need the opportunity "to solve problems that require them to work cooperatively (and individually), to use technology, to address relevant and interesting mathematical ideas, and to experience the power and usefulness of mathematics." (NCTM, pp. 75–76) By the time students reach the secondary level, many problem-solving strategies should be internalized and problem solving should be a process for constructing and reinforcing mathematical concepts.

Students should be confident and flexible problem solvers, using a wide range of strategies in their work, and accept that some problems have different solutions.

NCTM PROBLEM-SOLVING STANDARDS

K–4	5–8	9–12
The study of mathematics should emphasize problem solving so that students can:	*The mathematics curriculum should include numerous and varied experiences with problem solving as a method of inquiry and application so that students can:*	*The mathematics curriculum should include the refinement and extension of methods of mathematical problem solving so that all students can:*
• use problem-solving approaches to investigate and understand mathematical content • formulate problems from everyday and mathematical situations • develop and apply strategies to solve a wide variety of problems • verify and interpret results with respect to the original problem • acquire confidence in using mathematics meaningfully.	• use problem-solving approaches to investigate and understand mathematical content • formulate problems from situations within and outside mathematics • develop and apply a variety of strategies to solve problems, with emphasis on multistep and nonroutine problems • verify and interpret results with respect to the original problem situation • generalize solutions and strategies to new problem situations • acquire confidence in using mathematics meaningfully.	• use, with increasing confidence, problem-solving approaches to investigate and understand mathematical content • apply integrated mathematical problem-solving strategies to solve problems from within and outside mathematics • recognize and formulate problems from situations within and outside mathematics • apply the process of mathematical modeling to real-world problem situations.
(NCTM, p. 23)	(NCTM, p. 75)	(NCTM, p. 137)

©Alberta Education, Alberta, Canada

Reasoning

Reasoning helps students to make sense of mathematics and to be logical in their thinking.

Students need to develop confidence in their ability to reason and to justify their thinking within and outside of mathematics. The power of reasoning helps students to make sense of mathematics, to be logical in their thinking, and to convince others.

Inductive reasoning helps students explore and make conjectures from activities that allow generalizations from a pattern of observations.

Deductive reasoning helps students test conjectures and build arguments that serve to validate thinking. Deductive reasoning builds a structured body of knowledge.

NCTM REASONING STANDARDS

K–4	5–8	9–12
The study of mathematics should emphasize reasoning so that students can:	*Reasoning shall permeate the mathematics curriculum so that students can:*	*The mathematics curriculum should include numerous and varied experiences that reinforce and extend logical reasoning skills so that all students can:*
• draw logical conclusions about mathematics • use models, known facts, properties, and relationships to explain their thinking • justify their answers and solution processes • use patterns and relationships to analyze mathematical situations • believe that mathematics makes sense.	• recognize and apply deductive and inductive reasoning • understand and apply reasoning processes, with special attention to spatial reasoning and reasoning with proportions and graphs • make and evaluate mathematical conjectures and arguments • validate their own thinking • appreciate the pervasive use and power of reasoning as a part of mathematics.	• make and test conjectures • formulate counterexamples • follow logical arguments • judge the validity of arguments • construct simple valid arguments.
(NCTM, p. 29)	(NCTM, p. 81)	(NCTM, p. 143)

Technology

Technology will aid students in solving complex problems.

Improvements in technology, and its increased availability in schools, have changed the focus of mathematics education. The time saved by using calculators or computers to perform complex calculations can be used to help students better understand mathematical concepts. Students can then understand the relationships among concepts and use these relationships to solve problems.

Calculators and computers can be used as tools to:

- develop concepts
- explore and demonstrate mathematical relationships and patterns
- organize and display data
- assist with solving problems and thus promote independence
- encourage students to be inquisitive and creative
- decrease the time spent on tedious computations
- reinforce the learning of basic number facts and properties
- develop an understanding of computational algorithms

©Alberta Education, Alberta, Canada

- create geometric displays
- simulate situations.

In some cases, technology will allow teachers to ask questions requiring a high level of thinking and will allow students to solve complex, multifaceted problems. Technology can foster environments in which the growing curiosity of students can lead to rich mathematical discoveries. In these environments, the control of exploring mathematical ideas can be turned over to students.

Visualization

Images are useful in describing the physical and mathematical environment.

Visualization "involves thinking in *pictures* and *images* and the ability to perceive, transform and re-create different aspects of the visual–spatial world." (Armstrong, p. 10, italics in original) The use of images in the study of mathematics provides students with the opportunity to understand mathematical concepts and to make connections among them.

The physical environment is full of images. The images are of 3-D objects, 2-D shapes, 1-D lines and pictures. In geometry, the study of a 3-D object is assisted by visualizing either the net of 2-D shapes or the skeleton of 1-D lines required to construct the object.

The mathematical environment is full of images. These images are used to communicate mathematical concepts and multiple solutions to problems. At an elementary level, four piles, each containing three coins, can be used to represent $3 + 3 + 3 + 3 = 12$. Rearranging the piles into four rows of 3 can then be used to represent $4 \times 3 = 12$. Connecting the two images links the process of multiplication with that of repeated addition. At a more advanced level, analytic geometry describes figures algebraically and provides a tool for the visualization of algebraic relations. The analysis and interpretation of data, using a visual summary, aids in understanding the data and making predictions from it.

NATURE OF MATHEMATICS

- *Change*
- *Constancy*
- *Dimension*
- *Number*
- *Pattern*
- *Quantity*
- *Relationships*
- *Shape*
- *Uncertainty*

By enriching our view of mathematics and the learning environment, the outcomes of the program of studies can be accomplished.

The brain is constantly looking for and making connections. "Because the learner is constantly searching for connections on many levels, educators need to orchestrate the experiences from which learners extract understanding. . . . Brain research establishes and confirms that multiple complex and concrete experiences are essential for meaningful learning and teaching." (Caine, p. 5)

There are additional critical components that must be addressed in a mathematics program beyond those listed as mathematical processes. The components discussed are: Change, Constancy, Dimension (size and scale), Number, Pattern, Quantity, Relationships, Shape and Uncertainty. They are used to describe mathematics in a broad way in order to establish the wide variety of connections that can be made among the various strands used to organize the outcomes central to the program of studies.

Change

Change is a very broad concept. Students must become sensitive to patterns, such as linear, exponential, logarithmic and periodic.

Change can be discussed from Kindergarten to Grade 12 across many aspects of mathematics. The study of change is often discussed in the context of calculus, but is often limited to this context. However, change is a much broader concept than that used in calculus. In order to

©Alberta Education, Alberta, Canada

make predictions, students need to describe and quantify their observations, attempt to build patterns, and identify those quantities that remain fixed and those quantities that change. For example, look at the pattern 4, 6, 8, 10, 12, . . . An elementary school student can describe this as skip counting by 2s, starting from 4. A senior high school student may describe this pattern as an arithmetic sequence, with first term 4, and a common difference of 2. Another student may describe it as a linear function with a discrete domain. All three interpretations are focusing on the changing size of the numbers within the sequence. To be able to understand change, students must become sensitive to patterns, such as linear, exponential, logarithmic and periodic. (Steen, p. 184)

Constancy

Constancy is described by the terms stability, conservation, equilibrium, steady state and symmetry.

Students are expected to communicate ideas visually, using diagrams and oral and written words, when describing constancy or invariance. Different aspects of constancy "are described by the terms stability, conservation, equilibrium, steady state, and symmetry." (AAAS–Benchmarks, p. 270) The most important properties in mathematics and science relate to those properties that do not change when outside conditions change. Elementary school students deal with constancy in situations where different methods are used to solve a single multiplication problem, such as finding the area of a 3-tile by 4-tile tabletop. Secondary students need to deal with constancy when they solve the more complicated multiplication problems that appear in determining the number of elements present in the sample spaces of probability problems. Many of these situations will involve permutations and combinations.

In geometry, a circle can be transformed into an ellipse by a simple stretch, and into a square by a more complex series of transformations; but there is no way that the circle can be transformed into a parabola. The closed figures, such as circles and squares, remain closed and cannot be transformed into open figures, such as parabolas. Triangles can be distorted in many ways, but all will have an angle sum of 180°. The straight line is characterized as having all its parts with the same slope. In solving many of the most important problems in mathematics, students need to concentrate on the properties that remain constant. This idea enables students to solve problems involving constant rates of change, lines with constant slope, direct variation situations, or the angle sums of polygons.

Dimension (size and scale)

The concept of dimension needs to be developed within an environment of physical objects.

The concept of dimension, most usually associated with 3-D objects, 2-D shapes or 1-D lines, needs to be developed within an environment of physical objects for all grades from Kindergarten to Grade 12. The prediction of the change in dimension of objects can be done using numbers attached to appropriate units. For example, with no knowledge of a formula, students in upper elementary grades can predict that doubling the side of a square generates four times the area. Junior and senior high school students need to be able to use algebraic structures to formalize this relationship.

Physical objects can all be described using measurement concepts. The development of perimeter, area and volume concepts relies on pattern recognition, not on memorization of formulas. Descriptions of geometric patterns (number of vertices, sides and edges of various 3-D objects, 2-D shapes and 1-D lines); and the angle sum of various 2-D shapes is also encouraged. This type of data should be placed in charts and/or graphs to help students visualize their findings and predict patterns.

©Alberta Education, Alberta, Canada

Number

The use of number must include number sense.

Number, number systems and the operations on numbers are vital to all mathematics learning. The use of number must go beyond procedure and accuracy to include what is called number sense. Number sense includes:

- an intuitive feeling about numbers and their multiple relationships
- construction of the meaning of number through a variety of experiences, and development of an appreciation of the need for numbers beyond whole numbers (NCTM, p. 38)
- an appreciation and ability to make quick order of magnitude approximations (Steen, p. 79) with emphasis on establishing quick and accurate estimations for computation and measurement
- the ability to detect arithmetic errors
- knowledge of place value and the effects of arithmetic operations.

Many numerical calculations are performed with calculators and computers, and students must be able to determine if the desired calculations have been done correctly. Students must plan for the efficient use of technological tools.

Number patterns should be recognized and used to count, to make predictions, to describe shapes and to compare.

Pattern

Mathematics is an exploratory science that seeks to understand every kind of pattern.

"What humans do with the language of mathematics is to describe patterns. Mathematics is an exploratory science that seeks to understand every kind of pattern. . . ." (Steen, p. 8) Patterns exist in number, geometry, algebra and data. By helping students recognize, extend, create and use patterns as a routine aspect of their lives, mathematics will become a useful tool to assist them in their systematic and intellectual understanding of their environment.

Quantity

Quantitatively literate people use numbers to describe phenomena in all aspects of mathematics.

"Quantitatively literate young need a flexible ability to identify critical relations in novel situations, to express these relations in effective symbolic form, to use computing tools to process information, and to interpret the results of those calculations." (Steen, p. 65)

Students have a strong desire to measure, code and order things. To this end, some of the outcomes are about single numbers, numbers attached to units of measure, and ordered sets of numbers. Other outcomes are about the interpretation of numbers and of number systems. The use of single numbers and of ordered pairs to describe phenomena in all aspects of mathematics, the natural sciences and the social sciences is very important.

With the growing use of technology to process numerical information, it is becoming essential for students to have a wide range of estimation skills so that they can evaluate whether or not the numerical output provided by a calculator or a computer is a reasonable solution to a given problem.

Relationships

The study of mathematics is the development of relationships between and among things.

The study of mathematics is the development of relationships between and among things. Part of mathematics should help students develop a sense of discovery that mathematicians over the years have felt and should prepare the way for students to make their own discoveries. Students should look for relationships among physical things, as well as the data used to describe those things. Descriptions of the attributes of objects are used to analyze symmetry and congruence and to classify things, using increasingly sophisticated language. Relationships will be described visually, symbolically, orally and in written form.

©Alberta Education, Alberta, Canada

Shape

Shape in mathematics includes geometric representations of algebraic relations, the geometry of maps and the creation of networks of figures.

Shape in mathematics is central to geometry but also includes geometric representations of algebraic relations, the geometry of maps and the creation of networks of plane figures that can be used to construct 3-D objects. It is very important for students to look for and use similarities, congruences, patterns, transformations, dilatations and tessellations in the solution of a range of problems.

The use of language to describe shapes is an important aspect of mathematics. This description allows for the classification of objects according to various attributes, the naming of objects, and the analysis of objects. The study of shape can be used to build a deductive system, which can assist in further, more detailed analysis. Shape is used in the development of visual models in other disciplines, such as the use of molecular models in chemistry and biology.

The use of technology to analyze and depict shape will increase in importance for students of mathematics as more and better software and hardware become available in classrooms.

Uncertainty

Uncertainty involves data, chance, measurements and errors.

Uncertainty involves data, chance, measurements and errors. Problems dealing with data, together with numbers in context found in the mass media, can be solved within the school mathematics program so long as the data provided and the problems posed have some meaning and relevance to students.

Chance deals with the predictable and the unpredictable outcomes of events. Students from an early age are expected to deal with the concept of chance. As they mature, the language they use to describe chance becomes more sophisticated and involves the vocabulary of probability theory.

When dealing with random events and complex experiments, students can generate large quantities of data requiring analysis. The use of various technologies enables the student to summarize data easily and to create a visualization of the data to help identify patterns in the information. In some instances the functions describing patterns are linear, periodic, logarithmic or exponential, and senior high school students are expected to use the appropriate algebraic structures to model the information contained within the pattern.

The quality of the output information is directly related to the quality of the input data. The study of uncertainty allows students to assess the reliability of input data, and to learn the processes whereby input data is converted to output information.

STRANDS

- *Number*
- *Patterns and Relations*
- *Shape and Space*
- *Statistics and Probability*

The student outcomes are organized within four strands. The strands are the formal aspects of the discipline of mathematics that form the foundation of the program of studies and act as connections across the grades. Four strands have been identified for the program of studies to reinforce the interrelationship of mathematical concepts and skills. These strands are split into substrands. However, any such grouping into strands and substrands is for organizational purposes only, and does not reflect the connections among the strands and the underlying themes running throughout all of mathematics.

©Alberta Education, Alberta, Canada

Number

Number Concepts

Students will:

- use numbers to describe quantities
- represent numbers in multiple ways.

Number Operations

Students will:

- demonstrate an understanding of and proficiency with calculations
- decide which arithmetic operation or operations can be used to solve a problem and then solve the problem.

Patterns and Relations

Patterns

Students will:

- use patterns to describe the world and to solve problems.

Variables and Equations

Students will:

- represent algebraic expressions in multiple ways.

Relations and Functions

Students will:

- use algebraic and graphical models to generalize patterns, make predictions and solve problems.

Shape and Space

Measurement

Students will:

- describe and compare everyday phenomena, using either direct or indirect measurement.

3-D Objects and 2-D Shapes

Students will:

- describe the characteristics of 3-D objects and 2-D shapes, and analyze the relationships among them.

Transformations

Students will:

- perform, analyze and create transformations.

Statistics and Probability

Data Analysis

Students will:

- collect, display and analyze data to make predictions about a population.

Chance and Uncertainty

Students will:

- use experimental or theoretical probability to represent and solve problems involving uncertainty.

STUDENT EXPECTATIONS

The content of the program of studies is stated in terms of outcomes. These outcomes are measurable and identify what students are required to know and be able to do.

The outcomes are developed and based on the expectation that they are appropriate to a large majority of the students. There may be some time delays between where students first encounter the learning and where they are expected to demonstrate knowledge of, or mastery in, that learning.

©Alberta Education, Alberta, Canada

Student expectations are described in terms of:

- *general outcomes*
- *specific outcomes*
- *illustrative examples.*

General Outcomes

General outcomes are general statements that identify what students are expected to know and be able to do upon completion of a course.

Specific Outcomes

Specific outcomes are statements identifying the component knowledge, skills and attitudes of a general outcome.

Illustrative Examples

Illustrative examples are sample tasks that demonstrate and elaborate on the general and specific outcomes. They are important in conveying the richness, breadth and depth intended in the outcomes. The illustrative examples are for discretionary use.

SUMMARY

The components of the conceptual framework for Kindergarten to Grade 12 mathematics, as described, dictate what should be happening in mathematics education. The components are not meant to stand alone, but are to be interrelated to enhance one another. Activities that take place in the classroom should stem from a problem-solving approach built upon the seven mathematical processes. These processes lead students to an understanding of the nature of mathematics through specific knowledge, skills and attitudes related to each of the strands.

INSTRUCTIONAL FOCUS

SUGGESTED TIME ALLOTMENTS

The program of studies is arranged into four strands, each of significance. Therefore, considerable time should be spent on the concepts and processes identified in each strand.

Several additional considerations are important.

- Integration of the mathematical processes, within each strand, is encouraged and expected.

- By decreasing emphasis on rote calculation, drill and practice, and the size of numbers used in paper and pencil calculations, more time is available for concept development.

- Problem solving, reasoning and connections are vital to increasing mathematical power and must be integrated throughout the program. A minimum of half the available time within all strands needs to be dedicated to activities related to these processes.

- There is to be a balance between estimation and mental mathematics, paper and pencil exercises and the appropriate use of technology, including calculators and computers. Concepts should be introduced, using manipulatives, and gradually developed from the concrete to the pictorial to the symbolic.

- There is an assumption made that all students have regular access to appropriate technology. For Mathematics 14–24, calculators and standard spreadsheet programs are appropriate.

CODING OF OUTCOMES FOR MATHEMATICS 14–24

The specific outcomes for Mathematics 14 and Mathematics 24 have been numbered sequentially within each strand. Each specific outcome for Mathematics 24 has been cross-referenced to the Common, Applied or Pure outcomes of *The Common Curriculum Framework for K–12 Mathematics Grade 10 to Grade 12: Western Canadian Protocol for Collaboration in Basic Education*, 1996. For example, (A2–1) refers to Cluster Applied A2, Specific Outcome Number 1.

MATHEMATICS 14

Strand: Number (Number Concepts)
Students will:
- use numbers to describe quantities
- represent numbers in multiple ways.

[C]	Communication	[PS]	Problem Solving
[CN]	Connections	[R]	Reasoning
[E]	Estimation and Mental Mathematics	[T]	Technology
		[V]	Visualization

General and Specific Outcomes	Illustrative Examples [Discretionary]
General Outcome Develop and demonstrate a number sense for rational numbers, decimals, common fractions, integers and whole numbers. **Specific Outcomes** 1. Demonstrate and explain the meaning of ratio concretely, pictorially and symbolically. [C, CN, R, V]	1.1 Dennis linked 10 cubes together in this order: G G G G Y G G G G Y What ratio describes: 2:8 4:1 8:10 Suppose Dennis continued the pattern to cover a 10 by 10 grid. How would the ratios change? How would you use per cent to describe: – the green area? – the area not green? – the yellow area? Would it be true to write the following about the yellow area? $0.20 = \frac{2}{10} = \frac{1}{5}$ Explain. Sketch and label a 5-cube sequence. Describe the colours in different mathematical ways. 1.2 A fruit punch is made by mixing 3 L of pop with 1 L of orange juice. Model the situation with two different coloured tiles. Find the amount of pop required for 2 L, 3 L and 4 L of orange juice. Write each case as a ratio.

[CN]	Connections	[R]	Reasoning
[E]	Estimation and Mental Mathematics	[T]	Technology
		[V]	Visualization

General and Specific Outcomes	Illustrative Examples [Discretionary]
2. Represent and apply fractions as per cents and per cents in fraction or decimal form. [CN, E, PS, R, T]	2.1 Have students bring in examples of ratios, per cents, decimals and fractions from newspapers or magazines, or by searching the Internet. Discuss with the class why the chosen form was used in each case. Does one form tend to be used more often in particular types of media? Adapted with permission of the British Columbia Ministry of Education. 2.2 Give students lists of fractions and decimals to arrange in numerical order and place on a number line. Have students develop lists of rules based on their work, which they can use to place numbers in order. – Can students correctly order and place numbers? – Do they make conversions correctly? – Do the rules they identify accurately reflect the process? Reproduced with permission of the British Columbia Ministry of Education. 2.3 Have students use a chart to represent numbers taken from real-life data in as many ways as possible; e.g., ratio, fraction, per cent, decimal. 2.4 Have students practise calculating common percentages mentally; e.g., 7%, 15%, 25%, 50%. – What is the GST on a $90 pair of running shoes? – If 25% of the 600 people at a basketball game are with the visiting team, how many people is this? 2.5 Simulation: The stock market. Choose ten stocks that students are familiar with from the Toronto Stock Exchange. Give students a fictional amount of money to invest and have them track the movement of the stocks each day. Then, by converting to decimal fractions and per cents, have them calculate how much money they have made or lost. Adapted with permission of the British Columbia Ministry of Education.

©Alberta Education, Alberta, Canada

Strand: Number (Number Operations)
Students will:
- demonstrate an understanding of and proficiency with calculations
- decide which arithmetic operation or operations can be used to solve a problem and then solve the problem.

[C]	Communication	[PS]	Problem Solving
[CN]	Connections	[R]	Reasoning
[E]	Estimation and Mental Mathematics	[T]	Technology
		[V]	Visualization

General and Specific Outcomes	Illustrative Examples [Discretionary]
General Outcome Apply arithmetic operations on common fractions, decimals and integers, and illustrate their use in solving problems. **Specific Outcomes**	
3. Use patterns, manipulatives and diagrams to demonstrate the concepts of multiplication and division by a decimal. [C, CN, PS, R, V]	3.1 Revalue the base-10 blocks. For example, let the "flat" represent one. Then the "long" represents one tenth, and the "unit" represents one hundredth. The diagram below shows the multiplication 3.2×2.4.  Use base-10 blocks and this diagram to find the product and explain your procedure. 3.2 Jacques bought 13.2 m of fabric to make table cloths. Each cloth takes 2.4 m of fabric. How many table cloths can he make? Use base-10 blocks to find the answer. Explain how your answer is related to the answer you get on your calculator.
4. Use estimation strategies to justify or assess the reasonableness of calculations. [C, E, PS, R]	4.1 Liam bought 3 equally priced CDs and a tape priced at $11.95. He paid $71.20 in total. What was the cost of each CD? Before you calculate the exact answer, explain why it must be less than $24.00.
5. Add, subtract, multiply and divide decimals (for more than 2-digit divisors or multipliers, the use of technology is expected). [E, PS, T]	5.1 Apples cost $1.39 per kilogram. If you have $6.00, can you purchase a 3.75 kg bag of these apples? Explain how you could make an estimate to be sure, before you purchase the apples. Find the exact cost of the apples.

[CN]	Connections	[R]	Reasoning
[E]	Estimation and Mental Mathematics	[T]	Technology
		[V]	Visualization

General and Specific Outcomes	Illustrative Examples [Discretionary]
6. Add, subtract, multiply and divide integers concretely, pictorially and symbolically. [PS, V]	6.1 Show how you can use two different coloured cubes to represent the following numbers, and combine them. $(^{+}10) + (^{-}6) =$ $(^{-}4) + (^{-}7) =$ $(^{-}8) + (^{+}5) =$ 6.2 Calvin put equal numbers of white and black cubes in a container to make a neutral charge. He then put in 6 white cubes to make a charge of –6. From this container he removed four black cubes and wrote $(^{-}6) - (^{+}4) = (^{-}10)$. Show why this is true and use a similar method to find: $(^{+}5) - (^{-}2)$ $(^{-}3) - (^{-}5)$ $(^{+}7) - (^{+}6)$. 6.3 Hoang explained $(^{+}5) \times (^{-}2)$ as <u>putting</u> 5 groups of 2 white chips each <u>into</u> a container for a product of $^{-}10$. He explained $(^{-}6) \times (^{+}4)$ as <u>taking</u> 6 groups of 4 black chips <u>out</u> of a neutral container for a product of $^{-}24$. Using Hoang's reasoning, demonstrate and explain $(^{-}3) \times (^{-}5)$ and $(^{+}7) \times (^{+}6)$ 6.4 The temperature fell 2°C per hour for a total temperature change of –10°C. How many hours did this take? 6.5 Extend the following pattern, and describe the rule that is used. –3, 6, –12, . . . 6.6 Provide an answer and have students suggest as many questions as they can that would result in that answer; e.g.: A = 6, Q = 2 + 4, 3 x 2, 20 – 14, $\frac{1}{2}$ x 12, 24 ÷ 4 . . . Adapted with permission of the British Columbia Ministry of Education.
7. Illustrate and explain the order of operations, using paper and pencil or a calculator. [PS, T, V]	7.1 Determine the missing operation signs so that the following statement is true. (7.4 ☐ 2.1) ☐ 14 = 1.11 7.2 Place parentheses in the following equation to make it true. $4 + 5 \times 3 - 8 = 19$

General and Specific Outcomes	Illustrative Examples [Discretionary]
8. Add, subtract, multiply and divide fractions concretely, pictorially and symbolically. [E, PS, V]	8.1 Eric ordered several large pizzas for a party. $1\frac{1}{2}$ pepperoni pizzas and $\frac{2}{3}$ of a pineapple pizza were not eaten. Was there the equivalent of more than one large pizza left over? Explain how you can estimate the answer. Add $1\frac{1}{2} + \frac{2}{3}$, using a pencil and paper method, and use paper circles to explain your method and your answer. 8.2 Mr. Blair's gas tank was $\frac{7}{8}$ full when he left home. He knows he will use $\frac{3}{4}$ of a tank of gas on his errands. Will he have enough fuel to do his errands. Use fraction strips to explain your method and your answer. 8.3 Lisa had $\frac{3}{4}$ of a large candy bar. She gave $\frac{1}{3}$ of what she had to Shannon. Explain how you know that Shannon got less than $\frac{1}{3}$ of a whole bar by: – multiplying $\frac{1}{3} \times \frac{3}{4}$, using a pencil and paper method – explaining your method and your answer by folding a piece of paper that represents a whole candy bar. 8.4 Miko has $2\frac{1}{2}$ m of blue cloth. How many pieces $\frac{1}{4}$ m long can she cut from her piece? Estimate the answer and explain the solution by: – dividing $2\frac{1}{2} \div \frac{1}{4}$, using a pencil and paper method – using Cuisenaire rods to explain your method and your answer. 8.5 In the community hall, $\frac{1}{4}$ of the people present are men, $\frac{1}{3}$ are women and the rest are children. There are 840 people in the hall. How many children are there?

General and Specific Outcomes	Illustrative Examples [Discretionary]
	8.6 Provide students with a recipe that contains fractions; e.g., $\frac{1}{3}$ cup, and ask students how they would double or triple the recipe. Have them determine when they would use mathematics to calculate new amounts of ingredients and when they would simply duplicate the original amounts. How would they halve the recipe? Have students use measuring cups and water to represent the situation and verify solutions. Adapted with permission of the British Columbia Ministry of Education.
	8.7 Invite students to play games and create their own games that incorporate operations with rationals; e.g., mathematics crossword, mathematics bingo, who am I? Adapted with permission of the British Columbia Ministry of Education.
9. Estimate, compute and verify the sum, difference, product and quotient of rational numbers, using only decimal representations of negative rationals. [E, PS, T]	9.1 The temperature in the morning was 7°C. By noon the temperature went up 9°C. By late afternoon it fell 8°C, and by midnight it dropped another 9°C. What is the final temperature?

General and Specific Outcomes	Illustrative Examples [Discretionary]
General Outcome Apply the concepts of rate, ratio, percentage and proportion to solve problems in meaningful contexts. **Specific Outcomes** 10. Estimate and calculate percentages. [E, PS, T]	10.1 Les Krantz, in his book called *What the Odds Are* found that men will suffer severe hair loss—baldness—by the time they reach the age ranges listed below: 20–29: 1 in 5 30–39: 3 in 10 40–49: 2 in 5 50–59: 1 in 2 60–69: 2 in 3 70–79: 3 in 4 How many men in every hundred would you expect to have lost most of their hair by the time they reach these age ranges? a) 20 to 29 b) 40 to 49 c) 60 to 69 Predict the percentage of men between the ages of 80 to 89 who will be bald. Explain your reasoning for your prediction. 10.2 John said that an increase from 5 to 20 is a 300% increase, then that means a decrease from 20 to 5 must be a 300% decrease. What is wrong with John's reasoning? 10.3 Almost 14% of Canada's land surface is covered by wetlands. If Canada's land surface is 1020 million hectares, how many hectares are covered by wetlands?

General and Specific Outcomes	Illustrative Examples [Discretionary]
11. Derive and apply unit rates. [PS, R]	11.1 A carpenter bought 2.5 kg of nails. The total cost was $3.75. What was the cost of 1 kg? 11.2 Toothpaste is advertised as 75¢ for a 50 mL tube. A 75 mL tube is priced at $1.09. Which is the better buy? Why? 11.3 Compare values, using flyers from two grocery outlets. 11.4 Have students compare the cost of 1 kg of bulk peanuts with the cost of 1 kg of peanuts bought in smaller packages. 11.5 Travelling from Saskatoon to Regina, a distance of 276 km, took 3 hours. What was the rate?
12. Express rates and ratios in equivalent forms to solve problems. [PS, R, T]	12.1 Gas usage is expressed as the rate of number of litres of gas used per 100 km. On a 225 km trip, Nadia used 20.5 L of gas. Express her usage in terms of the above rate. Why do you think this type of rate is used? 12.2 In Canada, there are 1 million curlers registered in 1200 clubs. In Scotland, there are 50 000 curlers in 52 clubs, and in Sweden there are 9000 curlers in 36 clubs. Write a ratio for each to compare the number of curlers to the number of clubs, and arrange these in order of size from least to greatest. 12.3 Using a spreadsheet template and the ratios calculated in 12.2, find the number of curlers for 1 club; i.e., a rate, as well as for 36, 52 and 1200 clubs for each country. Your template should appear similar to the one that follows: Number of Curlers Country | 1 club | 36 clubs | 52 clubs | 1200 clubs Sweden | | 9000 | | Scotland | | | 50 000 | Canada | | | | 1 000 000

12.4 Have you read, or heard of, the book by Jonathan Swift called *Gulliver's Travels*? Gulliver, a ship captain, suffers a shipwreck, and finds himself in the land of Lilliput. Here he finds that the heights of the people, plants and animals are in a 1:12 ratio to the heights of the people, plants and animals in his world. Use a measuring tape to measure yourself. Then complete this chart.

Body Part	Actual Length	Length in Lilliput
Length of middle finger		
Length of your foot		
hat size		

Each day the Emperor of Lilliput gave Gulliver the food and drink necessary to feed about 1 728 Lilliputians. How did the Emperor's mathematicians arrive at this number? Explain why this should be about the right amount.
*could use SI or imperial units.

12.5 Which is the better buy:
1.2 L orange juice for $2.50 or 0.75 L orange juice for $1.40?

12.6 Walter and Pat have the same ratio of country CDs to rock CDs. Walter has 3 country CDs for every 5 rock CDs. Pat has 48 country and rock CDs altogether. How many of Pat's CDs are rock?

[CN]	Connections	[R]	Reasoning
[E]	Estimation and Mental Mathematics	[T]	Technology
		[V]	Visualization

General and Specific Outcomes	Illustrative Examples [Discretionary]
General Outcome Use patterns, variables and expressions, together with their graphs, to solve problems. **Specific Outcomes** 1. Generalize a pattern arising from a problem-solving context, using mathematical expressions and equations, and verify by substitution. [C, CN, PS, R]	1.1 Long-Foi made the following pictures with circles and triangles.  He started making a chart to show the number of circles and triangles in each picture. Complete Long-Foi's chart and look for a pattern. Write a mathematics sentence to show the relationship between the number of circles and the number of triangles. Make concrete models or pictures to verify your answers. How many circles would you need in a picture with 12 triangles? How can you find and verify the answer? Substitute numbers in your sentence for each picture. 1.2 Read students the story *The King's Chessboard*, by David Birch. Have students explore pattern, by predicting the amounts that will result if one used a doubling pattern to cover the chessboard with grains of rice: one grain in the first square, two grains in the second square, four grains in the third square, and so on. Have them estimate the total number of grains and then find a way to calculate the result.

Picture	Number of Circles	Number of Triangles

General and Specific Outcomes	Illustrative Examples [Discretionary]
2. Interpolate and extrapolate number values from a given graph. [E, PS, V]	2.1 The graph shows how much Carol pays per month for her cellular telephone use outside of prime-time hours—7 p.m. to 7 a.m.  – If Carol uses her telephone for 20 minutes in one month, how much will her telephone bill be? How much will her bill be, if she uses her telephone for 85 minutes? Explain. – If Carol uses her telephone for 130 minutes, how much will her telephone bill be? – If Carol's bill for the month was $65, how many minutes did Carol talk on the telephone? – Estimate how much Carol's telephone bill would be, if she used her telephone for 240 minutes in one month. Extend the graph to check your estimate. – Explain in words how Carol gets charged by the cellular telephone company.
3. Graph relations, analyze the result and draw a conclusion from a pattern. [R, V]	3.1 Measure the sides of each of the squares provided. Find the perimeter of each square. Make a graph by plotting the length of the sides on the horizontal axis and the perimeters on the vertical axis. Describe the pattern in the graph. From the results of this graph, make a rule for finding the perimeter of a square. Explain how you could verify your rule.

General and Specific Outcomes	Illustrative Examples [Discretionary]
4. Substitute numbers for variables in expressions, and graph and analyze the relation. [C, PS, R, V]	4.1 Mitch got a job at "Ease-a-phone", a new cellular telephone company. He will be paid $20 a day plus $8.50 for every new customer he signs to an "Ease-a-phone" contract. Mitch used the expression E = C+20 to determine his earnings per day—E stands for earnings, and C stands for new contracts. C | 0 | 1 | 2 | . . . E | 20 | 28.50 | 37.00 | . . . – Continue Mitch's chart and make a graph to show the relationship. Analyze the graph. – What axis will be used to represent earnings? contracts? why? – Will you join the points on the graph with a line? Explain. – Discuss the pros and cons to this kind of earnings arrangement.
5. Translate between an oral or written expression and an equivalent algebraic expression. [C, CN]	5.1 Write an algebraic expression for the following: When a number is doubled and increased by seven, the result is twenty. 5.2 Describe the following algebraic equation in words. $\frac{x}{2} + 5 = x + 2$ 5.3 Carl has 30 coins, all dimes and quarters. Write an expression to represent the number of dimes, if he has x quarters.

[E]	Estimation and Mental Mathematics	[T]	Technology
		[V]	Visualization

General and Specific Outcomes	Illustrative Examples [Discretionary]
General Outcome Use variables and equations to express, summarize and apply relationships as problem-solving tools. **Specific Outcomes**	
6. Evaluate expressions with and without concrete models. [R, V]	6.1 An expression for the mass of two cans and five marbles is $2c + 5m$. Find the total mass, if each can has a mass of 200 g and each marble a mass of 75 g. 6.2 A formula for finding the perimeter of a rectangle is $P = 2(l + w)$. Find the perimeter when l is 8 cm and w is 6 cm.
7. Solve and verify one-step linear equations, using a variety of techniques including concrete materials and diagrams. [PS, R]	7.1 Have students use manipulatives or models to explore the concept of balance or equality; e.g., have students use: – a weight balance – hands-on equations. Adapted with permission of the British Columbia Ministry of Education. 7.1.1 Jill had some CDs in a case. After Jay gave her 7 more, she had 12 CDs in all. How many CDs were in the case? Jose wrote the equation $C + 7 = 12$. He used a balance scale model to solve it. Let represent the CDs Jill originally had.  He took 7 CDs off each side.  Illustrate Jose's method in solving the following problem: Bill had six books. Teruko gave him some more, and then he had 10 books. How many books did Teruko give Bill?

General and Specific Outcomes	Illustrative Examples [Discretionary]
	7.1.2 Sharon had some money, she spent \$5 and then she had \$7 left. How much money did Sharon have to begin with? Ted wrote the equation $m - 5 = 7$ and used algebra tiles to solve it.  $m - 5 = 7$ $m - 5 + 5 = 7 + 5$ $m = 12$ Sharon had \$12 to begin with. Use Ted's method to solve: Barb had some sports cards. She sold six and then she had 10 left. How many did she have to start with?
	7.2 Have students solve equations, showing all their work. Ask them to exchange solutions with other students and use keys to mark each other's work. Students can identify the errors in their peers' solutions and explain how to fix them, and they can use partner feedback to correct their own work. Adapted with permission of the British Columbia Ministry of Education.
	7.3 Discuss with students the value of algebraic operations for solving problems. Have them consider longer, more complicated equations that can be solved easily and quickly using algebra but that take much longer to solve using arithmetic. Adapted with permission of the British Columbia Ministry of Education.
8. Solve and verify two-step, single-variable, first-degree equations, using concrete materials, diagrams or informal algebraic methods. [CN, PS, V]	8.1 Nat had some stamps. He divided them into sets of six to put in his album. He made 17 sets. How many stamps did Nat have? 8.2 Joe had 5 sports cards. He bought 3 packs with the same number of cards in each pack. If he now has 35 cards in all, how many were in each pack? Solve, by using algebra tiles. Write an equation you could use to solve this problem.

General and Specific Outcomes	Illustrative Examples [Discretionary]
	8.3 Hans gave Vera half his raffle tickets to sell. She lost seven of the tickets Hans gave her and had 23 left. How many tickets did Hans have to start with? Write an equation, and show how to solve it algebraically. Verify your answer by substituting it in your equation or by using counters.
	8.4 Suggest that students work in pairs to construct flow charts of equation-solving procedures, then switch with other pairs and attempt to apply the steps to a given problem. Is there more than one way to solve the problem? Discuss as a class.
	Reproduced with permission of the British Columbia Ministry of Education.
9. Solve and verify one- and two-step, first-degree equations of the form: • $x + a = b$ • $ax = b$ • $\frac{x}{a} = b$ • $ax + b = c$ where a, b and c are integers. [PS, V]	9.1 Kiotaka made 76 sandwiches for a party. If 29 were left over, how many were eaten? Write an equation and show how to solve it algebraically. Verify your answer by substituting it in your equation or by using base-10 blocks.
	9.2 Kassidy bought five CDs at the same price each and paid a total of $84.45. How much did each CD cost? Write an equation, and show how to solve it algebraically. Verify your answer by substituting it in your equation.
	9.3 Maria had a length of fabric to make banners. She divided the fabric into six equal pieces, and each piece was 2.75 m long. What was the length of the fabric? Write an equation, and show how to solve it algebraically. Verify your answer by substituting it in your equation or by using strips of grid paper.
10. Create and solve problems, using first-degree equations. [PS]	10.1 The following is some information that will be the basis of your constructing a word problem. It is 300 km from Regina to Gull Lake, Saskatchewan. About halfway between the two locations is Chaplin. Chelsea drives her car the speed limit on No. 1 highway. Alain drives his convertible 10 km slower than Chelsea. Write two problems or questions based on this information.

©Alberta Education, Alberta, Canada

Strand: Shape and Space (Measurement)
Students will:
- describe and compare everyday phenomena, using either direct or indirect measurement.

[C]	Communication	[PS]	Problem Solving

[E]	Estimation and Mental Mathematics	[T]	Technology
		[V]	Visualization

General and Specific Outcomes	Illustrative Examples [Discretionary]
General Outcome Estimate, measure and compare, using decimal numbers or fractions and standard Imperial and SI units of measure. **Specific Outcomes**	
1. Estimate, measure, record, compare and order objects by length, height, perimeter and circumference, using standard Imperial and SI units. [E, PS]	1.1 Use a micrometer to measure the thickness of 10 sheets of paper. Use the results of this measurement to determine the thickness of one sheet of paper. 1.2 Calculate the area of a flat rectangular surface measuring 21 feet by 14 feet.
2. Estimate, measure, record and compare the volume/capacity of containers, using standard Imperial and SI units. [E, PS]	2.1 Estimate the volume of a water bed bladder having a depth of 12 inches, a width of 5.4 feet and a length of 80 inches. 2.2 Measure the internal dimensions of a rectangular container, and calculate its volume in cm^3. Find its volume in litres, and verify using a calibrated cylinder.
3. Estimate, measure, record, compare and order the weight and mass of objects, using standard Imperial and SI units. [E, PS]	3.1 Fill three different empty tin cans with sand; e.g., a drink can, a soup can and a tuna can. Estimate the weight/mass of each. Use standard weights/masses and a balance scale to check your estimates. 3.2 Ask students to find objects that have a mass that is less than, more than and equal to 1 kilogram. Ask them to find objects that have a weight that is less than, more than and equal to 1 pound. Have them measure, record, compare and order the masses and weights. 3.3 Ask students to construct an object, using modelling clay, that is a pound/kilogram. Have them measure to determine accuracy and share their strategies for determining the weight/mass of their modelling clay object.
4. Estimate, read and record temperature to the nearest degree Fahrenheit or degree Celsius. [E]	4.1 Study the daily temperatures in a community for a week. Identify the daily high and low temperatures, and graph the daily highs, daily lows and daily differences. Have students work in pairs to share their data and pose questions to each other related to their findings. 4.2 Read and record the temperatures on thermometers placed in various locations; e.g., in the shade, in the Sun, beside a window or door. Compare the temperatures. What might account for any differences?

General and Specific Outcomes	Illustrative Examples [Discretionary]
General Outcome Generalize measurement patterns and procedures, and solve problems involving area, perimeter, surface area and volume. **Specific Outcomes** 7. Develop, verify and use rules or expressions for determining the areas and perimeters of polygons. [C, CN, PS, T]	7.1 The dimensions of five decorative gardens are given below. Which garden has the greatest area? – square with sides 10.2 m – rectangle with length 15 m and width 6.9 m – parallelogram with base 14.6 m and height 7.2 m – triangle with base 16.5 m and height 12.4 m – trapezoid with bases of 18.1 m and 10.4 m, and height 7.1 m. 7.2 Create a lake and island board by using the following directions: – a rectangular island A with an area of about 100 cm^2 – a triangular island B with an area of about 18 cm^2 – an irregular shaped island C with an area of about 50 cm^2 – a circular shaped island D with an area of about 25 cm^2. 7.3 You want to paint one wall of your room. The wall is 20 feet 4 inches long and 9 feet high. It takes one quart of paint to cover 100 ft^2, and the paint sells for $8.99 a quart. – What would it cost you, if you purchase only paint? – What else do you need to think of? 7.4 Melodie said that to find the perimeter of a triangle, you only have to measure one side and multiply by 3. Do you agree? Cut straws in several different lengths and make as many different triangles as you can. Use these straw triangles to explain your answer. Make a rule to find the perimeter of a triangle.

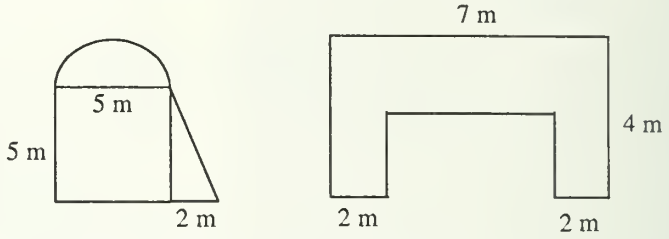
7.5 Ask students to estimate the perimeters and surface areas of composite shapes and objects, like the ones below, then measure, calculate and compare the derived values with their estimates. Have students use their journals to reflect on the differences between their estimates and the actual measurements. Students could use drafting software to check their estimates.



Adapted with permission of the British Columbia Ministry of Education.

7.6 Aaron sketched some parallelograms on grid paper and cut them out. Then he cut a piece off one end of each parallelogram and fit it on the other side to form a rectangle. He made this chart:

Base of Parallelogram	Height of Parallelogram	Area of Parallelogram	Base of Rectangle	Height of Rectangle	Area of Rectangle
3	4	12	3	4	12
2.5	3.5	8.75	2.5	3.5	8.75
1.5	4.2				
3	6.5				

Finish Aaron's chart, and look for a pattern. Test your pattern. Make a rule to find the area of a parallelogram. What other information should Aaron include on his chart to identify a pattern for finding the perimeter of a parallelogram?

7.7 Have students create simple blueprints of their dream homes, specifying the measurements of each room and calculating the areas and perimeters. Can students explain why it is important to know these measurements if they are going to build a house? Ask students to exchange their projects with other students and evaluate each other's work, using the following criteria:
- Are the measurements realistic?
- Based on the measurements students have supplied, are the calculations of area and perimeter accurate?

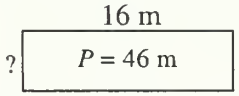
Collect and review the students' blueprints and the corrections and comments made by peers, and provide feedback.

Adapted with permission of the British Columbia Ministry of Education.

7.8 Give pairs of students maps of the world and select five countries for the class to study. Have each pair of students estimate the area of each country, using the map's scale and a centimetre grid. When they have finished, have them collect the class data and calculate an average area for each country. Have students consult the social studies text or another reference to check if the average determined by the class or an estimate determined by one of the pairs is closest to the actual area of each country. Encourage students to express the area in various ways; e.g., 3 400 000 km^2 or 3.4 million km^2.

Adapted with permission of the British Columbia Ministry of Education.

7.9 Domenico has forgotten one dimension of a room. What is the missing dimension.



Three students each began to solve the problem.

Domenico wrote: $P = L + W + L + W$
$46 = 16 + W + 16 + W$

Jake wrote: $P = (2 \times L) + (2 \times W)$
$46 = (2 \times 16) + (2 \times W)$

Owen wrote: $P = 2\ (L + W)$
$46 = 2\ (16 + W)$

Choose one boy's work and finish solving the problem. What is the missing dimension? Explain why you chose the work you did.

General and Specific Outcomes	Illustrative Examples [Discretionary]
	7.10 Have students ask people who use mathematics in their work about the types of measurement they use on the job. Report their findings back to the class.
8. Describe the effects of dimension changes in related 2-D shapes when solving problems involving area. [C, CN, PS, R, V]	8.1 Have students use pipe cleaners or other construction materials to determine if a constant perimeter gives a constant area. Reproduced with permission of the British Columbia Ministry of Education. 8.2 Barrie wanted to fence a rectangular garden area. The fencing material comes in 1-m lengths that cannot be cut. If Barrie has 12 m of fencing, what are the dimensions of the largest garden area he can make? Draw a diagram to explain your reasoning.
General Outcome Solve problems involving perimeter, area, surface area, volume and angle measurement. **Specific Outcomes**	
9. Estimate, measure and draw angles, using a circular protractor. [E]	9.1 Sketch and label a pizza that has been sliced to reveal these angles: 1—30°; 1—60°; 1—90°; 1—180°. Which piece would you be least likely to choose? Explain your choices. 9.2 Determine the approximate and exact measures of the angle between the hour hand and the minute hand when the clock reads 1:15. 9.3 Given the following circles:  – Use a protractor to measure the above angles: $\angle 1, \angle 2, \angle 3, \angle 4$. – Indicate the portion of the circle that each angle corresponds to; e.g., $\angle 3 = \frac{1}{2}$ circle. – If you had a circle divided into 6 equal parts through the centre, what would be the measure of each sector in degrees?

General and Specific Outcomes	Illustrative Examples [Discretionary]
10. Use mathematical reasoning to determine the measures of angles in a diagram. [R, V]	10.1 Find the measures of the indicated angles in the diagram below. General Outcome Solve problems involving the properties of circles and their connections with angles and time zones. **Specific Outcomes** 11. Measure the diameters, radii and circumferences of circles, and establish the relationships among them. [CN, R]	11.1 Gunther gathered a variety of circular objects, such as container lids and wheels. For each object, he measured the diameter with calipers and the circumference with a tape measure. He started making this chart:

Object	Diameter	Circumference	Relationship between Diameter and Circumference
nut can lid			
bicycle wheel			
coffee can			

He noticed a pattern in how the two measures for each object were related.
Estimate the relationship between diameter and circumference.
Test it by measuring the diameter of another object and predicting the circumference before measuring it.
Use your calculator to find the relationship in each case.
Make a rule that relates the diameter and circumference of a circle.

11.2 Have students compare the difference in area of small, medium and large pizzas. Ask them to construct a graph to represent the relationship between the diameter and the area for each size. What generalizations can they make for this relationship?

Reproduced with permission of the British Columbia Ministry of Education.

12. Solve problems involving the radii, diameters and circumferences of circles. [PS, T]	12.1 Elena is making a tablecloth for a round table with a diameter of 90 cm. She wants an overhang of 10 cm, which does not include the fringe. What length of fringe must she buy to decorate the edge of the tablecloth? 12.2 The pointed end on the minute hand of a clock travels 132 cm each hour. How long is the minute hand? 12.3 If Nel's bicycle wheel is 28 inches in diameter, how far can Nel go in one revolution? How far can she go in 10 revolutions? 12.4 The perimeter of the square *LMNP* is 60 cm. Find the: – diameter of the circle – circumference of the circle – area of the circle – area of the shaded region. General Outcome Apply indirect measurement procedures to solve problems. **Specific Outcomes** 13. Use concrete materials and diagrams to verify the Pythagorean relationship. [CN, R]	13.1 Tara is investigating the relationship among the three sides of a right triangle. She drew a right triangle in the middle of a sheet of grid paper and then constructed a square on each side of the triangle. Then she tried to cut the two smaller squares and fit them on the largest square. Try Tara's investigation, using right triangles with different shapes. Explain what you find. 13.2 Divide a piece of rope or string into 12 equal lengths, by placing tape on 13 spots. Ask three students to hold the rope in a way that constructs a triangle with a right angle—each student represents a vertex; one student holds the two ends of the rope together. Students should discover that there is only one solution. Discuss: – Can any other right triangle be made? – Does 3, 4, 5 always result in a right triangle? – What are the applications? Challenge students to design another way to divide a rope that produces a right triangle; e.g., 5, 12, 13=30 parts; 7, 24, 25=56 parts. Students could use a calculator to find the triples.

	13.3 Ask students to generate their own charts of Pythagorean triples and their multiples. For example: Original Triple | Times 2 | Times 3 | Times 10 3, 4, 5 | 6, 8, 10 | ___, ___, ___ | ___, ___, ___ 5, 12, 13 | ___, ___, ___ | 15, 36, 39 | ___, ___, ___ 7, 24, 25 | ___, ___, ___ | ___, ___, ___ | 70, 240, 250 Reproduced with permission of the British Columbia Ministry of Education.
14. Use the Pythagorean relationship to calculate the measure of the third side, of a right triangle, given the other two sides in 2-D applications. [PS]	14.1 Jamie wants to walk from one corner of the rectangular playing field to the opposite corner. The playing field is 90 feet by 150 feet. What is the shortest route he can take? Explain. 14.2 Invite students to find right triangles in the classroom. For each triangle, have students measure two of the sides and then use the Pythagorean relationship to calculate the third side. Are their calculations accurate? Can they explain the process? Reproduced with permission of the British Columbia Ministry of Education. 14.3 Provide pairs of students with a list of things to measure using the Pythagorean relationship. Ask students to compare their measurements in class and discuss the reasons for possible differences. Are the measurements reasonable? How plausible are their explanations of possible reasons for differences? Reproduced with permission of the British Columbia Ministry of Education.
15. Explain why the sum of the measures of the angles of a triangle is 180°. [C, R, T]	15.1 Myra drew several triangles of different sizes and shapes and cut them out. She marked the vertices and cut off the three vertices of each triangle. Make some triangles like Myra's, and explain how you can use the three vertices from each triangle to show that their sum is 180°.

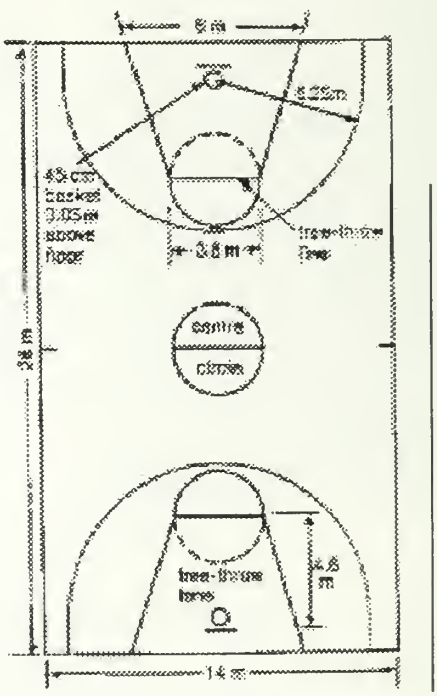
19.3 Your sister, who is in charge of physical education at the elementary school, noticed that the students in Grade 4 and Grade 5 were not enjoying basketball. She asked them why, and the students replied first that the game was too hard, and second that the basket was too high. You decide that the dimensions of the court could be changed to make it fairer and easier for smaller students.

The diagram below shows the dimensions of an international basketball court, like that used at the Olympic Games. All lengths on the diagram, except for the 45 cm diameter of the basket, are measured in metres.

The basketball used in international play has a diameter of 24.25 cm.



Problem—Make any changes to the dimensions of the court, the basket and the ball so as to make the game fairer and easier for Grade 4 and Grade 5 students. Explain the reasons for making the change, and show all the calculations that you made to justify the changes. Provide students with clues; e.g., state that 1.4:1.95 is the height ratio of Grade 4 and Grade 5 students to international basketball players, so that a plausible rationale can be given for scaling back.

General and Specific Outcomes	Illustrative Examples [Discretionary]
General Outcome Develop and implement a plan for the collection, display and analysis of data using technology, as required. **Specific Outcomes**	
1. Read and interpret graphs. [C, E, PS, R]	1.1 Find some graphs in your local newspaper. Working in a group, discuss the following questions. – Does the data give the information indicated? – Is the type of graph appropriate for the data? – Have scales, pictures or data groupings been selected to distort data? – Does the graph present data clearly? Is it visually appealing?
2. Select, defend and use appropriate methods of collecting data: • designing and using questionnaires • interviews • experiments • research. [C, PS, T]	2.1 As a member of your school's student council, you wish to determine the number of students who will attend a school dance. Explain how you could collect this information. 2.2 A city council is trying to determine if a major road in your district needs to be widened. Explain a procedure that could be used to help city council make this decision. 2.3 Bill surveyed people entering a theatre and asked them if they would support building a new sports arena in the community. Discuss this method of collecting data in terms of its appropriateness.
3. Interpolate from data to make predictions. [E, PS, R]	3.1 Collect data on the population of your school over the last 10 years. Graph the information. What would you predict the school population will be in six years? What trends do you see in the population? Can you suggest any reasons for these trends? Would enrollment figures suggest a need to increase the size of your school facility in the next ten years? Why or why not?

General and Specific Outcomes	Illustrative Examples [Discretionary]
General Outcome Evaluate and use measures of central tendency and variability. **Specific Outcomes**	
4. Determine measures of central tendency for a set of data: • mode • median • mean. [PS]	4.1 You are the statistician for the school football team and have been asked by the yearbook editor for the mean height of the 45 team members. You collect the heights of the 45 players. They vary from 5 feet 6 inches to 6 feet 8 inches, and are each measured to the nearest half-inch. Using a calculator or a computer: – describe in detail the keying procedures or menu choices that can be used to determine the mean height of the 45 players – show that your procedure works, by using it to find the mean of 5 feet 11 inches, 6 feet 2 ½ inches, 5 feet 9 inches, 6 feet 5 inches, and 5 feet 7 ½ inches.
5. Determine and use the most appropriate measure of central tendency in a given context. [CN, PS, T]	5.1 Explain why each of the following people might select the mean, median or mode in a set of data. – A store owner deciding what sizes of shoes to order. – Someone moving to a new city and looking at housing costs. – Reporting the average score on a test.
6. Display data by hand or by computer in a variety of ways, including circle graphs. [C, T, V]	6.1 Have students work in groups to research, via the Internet, examples of statistics used in a variety of situations; e.g., population statistics, professional sport, earthquake prediction, weather, loan risk. Students report their findings to the class, using appropriate graphs to display their data. Adapted with permission of the British Columbia Ministry of Education. 6.2 Keep a record of all your activities in a typical school day (24 h). Decide on categories for which the activities can be reported in number of hours (sleeping is an activity). Make a circle graph to show your typical school day. Share and compare graphs with other students. How can someone else's graph be useful to you?

General and Specific Outcomes	Illustrative Examples [Discretionary]
7. Discuss how collected data are affected by the nature of the sample, the method of collection, the sample size and biases. [C, CN]	7.1 Carmen designed and handed out 100 questionnaires to middle year students in her school. One question she asked was this: What do you want to be? Choose one. ☐ Doctor/Dentist ☐ Teacher ☐ Lawyer ☐ Sports Manager, Coach or Trainer 50 questionnaires were returned. Here are the results. Boys / Girls Doctor/Dentist: 𝍸 𝍸 / 𝍸 | Teacher: || / 𝍸 𝍸 | Lawyer: 𝍸 ||| / 𝍸 || Sports/Manager, etc.: 𝍸 / | Carmen reached the conclusion that most students will become doctors or dentists. Tell if you agree with each, and describe what else she might have done: – the wording of Carmen's question – the method of gathering data – the sample she chose to survey – the conclusion she reached.
8. Describe issues to be considered when collecting data; e.g., appropriate language, ethics, cost, privacy, cultural sensitivity. [C, CN, R]	8.1 For each of these questions: – Is there a relationship between wrist circumference and height? – Does smoking cause lung cancer? – Does pet ownership enhance the quality of life for senior citizens? Explain what would be the most appropriate methods for collecting data. Identify potential ethical problems, need for sensitivity to personal and cultural beliefs, and cost when designing questions and collecting data.

9. Assess the strengths, weaknesses and biases of samples and data collection methods. [C, R, T]	9.1 Find some data collected and presented in a local newspaper that are related to a current civic, regional or health issue. – Do the data seem to support the conclusions the newspaper makes? – Are the data presented in a fair, clear and appropriate manner? – What questions about the issue are not addressed?
10. Critique ways in which statistical information and conclusions are presented by the media and other sources. [C, CN]	10.1 Collect data presented via newspaper, magazine, radio or TV. – How were samples for the data selected? Why do you think they were selected that way? Are they biased? – Were the data collection methods appropriate for the data and the issue? – How would you do it differently? Why? – Are the data presented clearly and honestly? – Do the conclusions follow logically from the data? – What questions are left unanswered? Is this deliberate?

General and Specific Outcomes	Illustrative Examples [Discretionary]
14. Predict population characteristics from sample data. [C, CN]	14.1 For a picnic, Rosanna prepared some ham, some chicken and some cheese sandwiches. Rosanna prepared 5 ham sandwiches, 6 chicken sandwiches and 4 cheese sandwiches. Pauloosi's favourite sandwich is chicken. If he chooses a sandwich without looking, what is the probability that it is chicken? 14.2 A jar contains red and white jellybeans. There are 1000 jellybeans in all. Explain how you could draw samples from the jar, and use them to predict the number of red jellybeans in the jar.
General Outcome Explain the use of probability and statistics in the solution of complex problems. **Specific Outcomes** 15. Demonstrate an understanding of the role of probability and statistics in society. [C, CN]	15.1 Find examples from newspapers, radio, TV or other sources that use probability; e.g., marketing of products and services, weather forecasting, opinion polls. Are the data valid? Are they presented in an honest or in a misleading way? What assumptions are made?
General Outcome Create and solve problems, using probability. **Specific Outcomes** 16. Create and solve problems, using the numerical definition of probability as favourable outcomes divided by possible outcomes. [PS, R]	16.1 In pairs, draw a card from a deck of playing cards and record its value, regardless of the suit. Replace the card and draw again, recording the results. After doing this experiment 20 times, calculate the probability of drawing a jack from a standard deck of cards. Compare your results with another pair. Calculate the probability of drawing a jack based on the combined results of the class. Compare the results from your pair with those of the class. Calculate the theoretical probability of drawing a jack from a regular deck of cards and compare it to the experimental results.

General and Specific Outcomes	Illustrative Examples [Discretionary]
General Outcome Describe and apply arithmetic operations on tables to solve problems, using technology as required. **Specific Outcomes** 1. (A2–1) Solve problems involving combinations of tables, using: • addition or subtraction within tables • multiplication of a table by a real number • spreadsheet templates. [PS, T, V]	1.1 The following is an income and expenses report for a business for the year ending December 31.

	Year 1	Year 2	Year 3
Total Sales	$135 000	$148 000	$166 000
Expenses			
Accounting	$ 1 500	$ 1 600	$ 1 900
Advertising	2 000	2 000	3 000
Rent	12 000	14 000	16 000
Repairs	4 000	5 000	5 500
Salaries	74 000	79 000	81 000
Miscellaneous	10 000	13 500	9 000
Total Expenses	$103 500	$115 100	$116 400
Profit Before Tax	$ 31 500	$ 32 900	$ 49 600
Income Tax	$ 7 875	$ 8 225	$ 12 400
Net Profit	$ 23 625	$ 24 675	$ 37 200

1.1 (continued)

Enter the data from the previous page onto a spreadsheet template provided to students.

1.1.1 a) Calculate the dollar change in total sales and total expenses between each year in the table.
b) What are the reasons for the change in profit?

1.1.2 a) Calculate the percentage change in total sales and total expenses between each year in the table.
b) Do your results agree with your answer in 1.1.1(b) above? Explain.

1.1.3 Prepare a line graph showing total sales, total expenses and profit before tax for the three-year period. Use the graph to determine which item has increased the most. Does your graph agree with your previous results?

1.2 It costs $1.37 Canadian to buy 1 US dollar. **Note**: This rate changes daily.

a) Find the ratio of a Canadian dollar to a US dollar.
b) Find the ratio of a US dollar to a Canadian dollar.
c) How many US dollars will it take to buy 1 Canadian dollar?

These rates are located in currency tables and can be used to convert between different currencies.

	Canadian dollar	US dollar
Canadian dollar	—	1.37
US dollar	0.73	—

d) If you want to buy 500 US dollars, how many Canadian dollars would you have to spend?
e) Would it cost the same amount to buy $500 US in traveller's cheques? Explain.
f) Investigate commission rates charged by local financial institutions on money exchange transactions.

	5.2 The growth of a $500 RRSP invested at an interest rate of 9% per year, compounded annually, is shown on the right. a) Plot this data. b) Estimate the time needed for the RRSP to reach $1000. c) Determine the value of the RRSP after 10 years. d) Using a spreadsheet, estimate the value of the RRSP at the time of your retirement.
6. (C4–5) Solve investment and credit problems involving simple and compound interest. [CN, PS, T]	6.1 Calculate the amount, after various time periods (1 year, 5 years, 10 years, etc.) of a deposit of $1000. Assume the current nominal annual interest when the interest is compounded: a) annually b) monthly c) daily. Discuss the effects of compound interest. 6.2 a) Investigate the current GIC interest rate. If $2000 were deposited, for ten years, how much interest would be earned? b) A second bank offers an interest rate of 0.5% less per year, compounded quarterly. If $2000 were deposited, for ten years, how much interest would be earned? c) Discuss the results. 6.3 Calculate the interest paid on various forms of credit. Items for discussion may include: rate of interest, payment options, methods of calculating interest, etc. a) credit cards b) loans c) mortgages 6.4 You buy a bond for $1000.00 at 5.25% interest for the first year. The interest rate increases by 1% each year. Calculate the total interest you would receive after 5 years, assuming the interest earned is paid to you annually and is not rolled in to the next year's investment.

Time (years)	Value ($)

6.5

	Card 1	Card 2
Balance Owing	$750.00	$750.00
Interest Rate Per Year	15%	18%
Annual Card Fee	$36.00	$0.00

Use the information from the chart above to answer the following questions.

a) Find the interest charged on both credit cards for the month, using the formula:

Interest = Principal × Interest Rate × Time

Note: Principal = Balance Owing

b) Including the card fee, which card is cheaper to use to make a cash advance of $750.00 that is paid back after 30 days?

General and Specific Outcomes	Illustrative Examples [Discretionary]
General Outcome Modify an existing spreadsheet to make and justify financial decisions. **Specific Outcomes** 7. (A8–1) Modify a financial spreadsheet template to allow users to input their own variables. [C, PS, T]	7.1 Modify the following table to show: a) change in unit price b) change in labour rates.

ACME AUTO PARTS

Customer Inquiries

Item No.	Auto Parts	Quantity	Unit Price	Total	Labour	
1	Brake Pads	1	26.34	26.34	O/H Front Brakes	
2	Wheel Seals	2	5.25	10.50	1.5 hrs @ $57.00/hr	85.50
3	Rotor	1	30.16	30.16	Machined and Replaced Rotor	10.00
					Total Labour	95.50
					Total Parts	67.00
			Total Parts	67.00		
					GST (7%)	11.38
					TOTAL	$173.88

7.2 Roger kept good records of the costs of running his 1996 compact car for the 1998 calendar year. He found the following costs.

Cost Category	Cost Incurred
Depreciation	$2650.00
Insurance and registration	$840.00
Tires	4 at $72.50 each
Oil changes	5 at $32.85 each
Gasoline	3340 litres at 51.9¢ per litre
Repairs	$115.00 for a tune-up $277.50 for brakes
Parking	$44.50 per month for 12 months
Washing	27 washes at $4.25 each
Interest on borrowed money	$1145.00

a) What was the total cost of running Roger's car for the year?
b) If the price of gasoline increased to 58.6¢ per litre, how much **extra** would it cost Roger to run his car for the year?
c) Display the cost record as a graph.

8. (A8–2) Use spreadsheet software applications to analyze renting or buying an increasing asset (home) under different sets of circumstances. [C, PS, T]	8.1 The Wong family is faced with a move and has the choice of buying a home for $145 000 with a $25 000 down payment, or renting a similar house for $975 per month. Four options are available. 1. Buy the house with a 20-year mortgage and continue investing at the same rate after the mortgage is paid. 2. Buy the house with a 30-year mortgage. 3. Rent a house and invest the $25 000. 4. Rent a house and invest both the $25 000 and the difference each month between the rent and the mortgage payment. The analysis spreadsheets must include the following inputs: a) mortgage interest rate, taking 8.5% as a starting value b) taxation rate, taking 1.5% of market value as a starting value c) annual rent increase, taking 5% per annum as a starting value d) annual increase in house value, taking 4% per annum as a starting value e) investment return, taking 7.0% as a starting value. 8.1.1 Try different scenarios, varying from 5 years to 30 years. Summarize circumstances in which buying makes sense, and summarize circumstances when renting makes sense. 8.1.2 Investigate different scenarios, by varying such things as the interest rates, payment options and rent.

9. (A8–3) Use spreadsheet software applications to analyze leasing or buying a decreasing asset (vehicle, computer) under different sets of circumstances. [C, PS, T]	9.1 A car costs $15 366.05. A lease for the car runs for 36 months at $305 per month, with a down payment of $1105, a lease-end value of $7105 and an interest rate of 11.6%. The mileage restriction is 25 000 km/year. Excess mileage will cost 8¢/km. Maintenance is the purchaser's responsibility. Set up a spreadsheet to include the monthly values of the opening balance, interest paid, lease payment and closing balance. Use the spreadsheet to answer the following questions. a) What part of the $305 is used to pay the interest on the $7105? b) What total price is being charged for the car? How does this compare to buying the car outright at the beginning? c) What is the change in the monthly lease payment, if the lease-end value is reduced to $5700? d) What is the monthly payment for a straight purchase over 36 months when a 20% down payment has been made and there is an 11.6% interest rate? e) What is the annual percentage depreciation rate assumed with the $7105 lease-end value? f) If the car has a mileage of 85 827 km at the end of the lease, what will the extra mileage cost you? 9.2 Investigate the lease agreements from two institutions to compare the costs of leasing a similar vehicle from each.
10. (A8–5) Analyze car, property or house insurance needs and premiums, using such concepts as loss, compulsory coverage, optional coverage, deductible and claims record. [CN, E, R, T]	10.1 Obtain collision damage figures for inexperienced drivers and for experienced drivers from an insurance company, and then calculate a fair insurance premium for $1 000 000 liability, $250 deductible collision and $100 deductible comprehensive theft/glass coverage. Do the calculation twice, once for each type of driver. What change in premium would be fair, if the deductible for collision were raised to $1000? 10.2 At what point is it worth it to drop collision coverage on an older vehicle? Show a strategy, and explain the supporting calculations.

	1.6 A one cubic centimetre container holds 1 mL of water, which has a mass of 1 g. a) A fish tank at the aquarium is 150 cm long and 60 cm wide. How many millilitres of water are in the tank if it is filled to a depth of 25 cm? b) How many litres is this? c) In kilograms, what is the mass of water in this tank? Why might this be important to know?
2. Interpret drawings, and use the information to solve problems. (A1–4) [C, PS, V]	2.1 Use the drawings below to answer the following questions. a) A box manufacturing company produces 2 open boxes, as shown below. Are the volumes identical? Explain your reasoning. b) If the material cost is \$4.50/ft^2 and glue costs \$0.70/ft, which box is cheaper to make? How much do you save? c) If a company manufactures 1000 of the cheaper boxes in a production run, how much money is saved?

General and Specific Outcomes	Illustrative Examples [Discretionary]
General Outcome Demonstrate an understanding of scale factors, and their interrelationship with the dimensions of similar shapes and objects. **Specific Outcomes** 3. (A3–1) Enlarge or reduce a dimensioned object, according to a specified scale. [C, CN, PS, V]	3.1 A classroom has dimensions of 30 feet by 25 feet. Produce a scale drawing of the classroom to a scale of 5 feet:1 inch. 3.2 Using surveyor's chains, tapes or other linear measuring devices, measure a chosen plot of land, and calculate its area. Make a scale drawing, using the same measurement system for the drawing as was used with the measurement instruments. 3.3 From the scale drawing below, construct an actual sized model of the box.  3.4 To better visualize an object, designers often build models. Build a model of the tent that is shown in the net below, using the scale 10 cm = 1 m.

General and Specific Outcomes	Illustrative Examples [Discretionary]
General Outcome Use measuring devices to make estimates and to perform calculations in solving problems. **Specific Outcomes** 4. (A3–4) Design an appropriate measuring process or device to solve a problem. [E, PS, V]	4.1 Use right angles to measure base placement on a softball or baseball diamond. 4.2 Design a device to paint the circles on the ice at a curling rink. 4.3 Design an instrument you can use to determine the angle formed between the ground and the line of sight to the top of a tall building—angle of elevation.  E = angle of elevation 4.4 To calculate the number of students in your school who smoke, survey a class and use this data to estimate the number of smokers in your school. 4.5 Find the distance a car/bike tire travels in 10 revolutions.

General and Specific Outcomes	Illustrative Examples [Discretionary]
General Outcome Develop and apply the geometric properties of circles and polygons to solve problems. **Specific Outcomes** 5. (A3–5) Use properties of circles and polygons to solve design and layout problems. [CN, PS, V]	5.1 A standard sheet of paper is 28 cm by 22 cm, as is shown in the diagram below. You need to paste one table that is 10 cm by 6 cm and three tables that are 8 cm by 5 cm each onto the paper. The left, right and top margins on the page are 3 cm, and the bottom margin is 4 cm.  a) Prepare two possible layouts, assuming that the tables must be pasted with their long sides parallel to the left and right margins. b) Prepare two additional layouts with the long sides of the tables parallel to the top edge of the paper. c) What area is left over for including text on the page? Is this a reasonable amount? What percentage of the total area of the page is this?

5.2 A school has 293 students, all of whom have pictures to be put in the yearbook. The yearbook pages are 9.5 inches by 12 inches. The margins around the edge of the page must be 1 inch. Each photograph is 2 inches high and 1.5 inches wide. The minimum space between the edges of the pictures is 0.5 inches.

a) What is the maximum number of photographs that can be put on a single page?

b) Design a layout where:
- the number of pages is divisible by 8
- the least number of pages is used
- each page, except the last, has the same number of photographs.

5.3 A cylindrical can is 12 cm high and 6 cm in diameter. The can is closed, top and bottom. It is cut from a rectangular sheet of metal, and then the pieces are sealed together to form the can.

a) Determine the smallest rectangle that can be used to make one can.

b) What area of the metal is wasted?

c) What percentage of the metal is wasted?

5.4 The design of a water tank for seals is shown on the right. It is in the shape of an equilateral triangle with a semicircle attached to one side. Find the length of a guardrail around the whole tank.

General and Specific Outcomes	Illustrative Examples [Discretionary]
General Outcome Analyze graphs or charts of given situations to derive specific information. **Specific Outcomes** 1. (A4–1) Extract information from given graphs of discrete or continuous data, using: • time series • continuous data • contour lines. [C, CN, E, PS, R, V]	1.1 PROFIT/LOSS CYCLE FOR A DEPARTMENT STORE  A department store may experience "peaks" and "troughs" in its revenue (sales). Christmas season and summer holidays are the two strongest periods. January to April can be the weakest period. If net profits are greater than net losses over the year, the business can stay in operation. a) During periods of net loss, what might the business do for finances? b) Over which of the two curves, Sales or Costs, does the business have the most managerial control? c) Discuss the net profit for May.

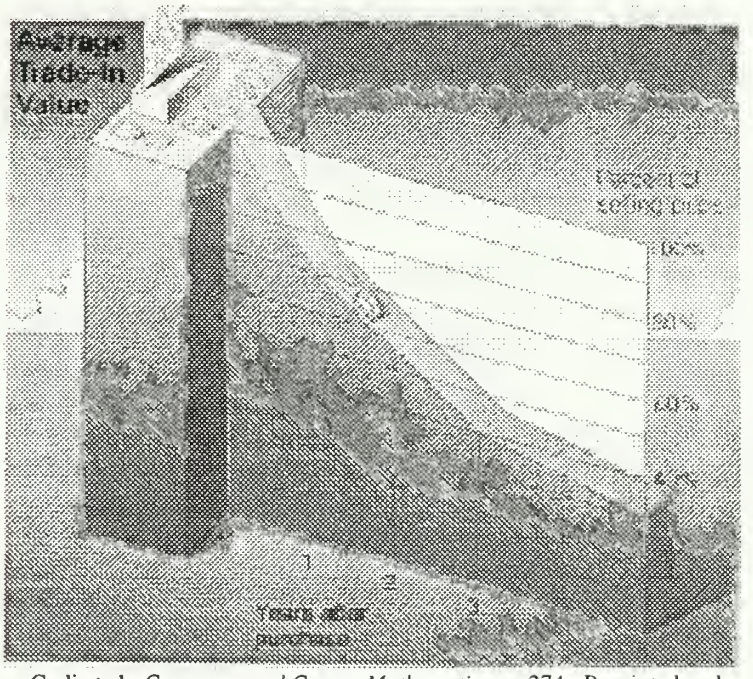
2. (A4–2) Draw and validate inferences, including interpolations and extrapolations, from graphical and tabular data. [CN, E, PS, V]	2.1 The trade-in value of a car decreases yearly. This loss in value is called depreciation and is illustrated in the graph below. The per cents given in the graph are based on the price of the car when it was new.



Carli et al., *Consumer and Career Mathematics*, p. 274. Reprinted and adapted with permission.

a) Mark and Cathy bought a new car for $18 900 two years ago. What is the approximate trade-in value of the car, and how much has the car depreciated?
b) Find the value of the car after 7 years.
c) Make a generalization about the depreciation of a new car over several years.

3. (A4–3) Design different ways of presenting data and analyzing results, by focusing on the truthful display of data and the clarity of presentation. [C, CN, T, V]	3.1 The amount of money Company A made doubled in 6 months. The following 4 graphs were given. i)  ii)  iii)  iv)  a) Which graph best represents the situation? b) Explain what is wrong with each of the other graphical representations and why they do not represent the situation. 3.2 The value of the Canadian dollar in terms of US cents is given in the following chart. These values are recorded in graphs A and B, which use different vertical scales. a) Do both graphs display the same data? b) Which graph is easier to read? c) Compare the vertical scales. How do they differ? d) What message is delivered by Graph A? by Graph B? Discuss the differences. (continued)

General and Specific Outcomes	Illustrative Examples [Discretionary]
General Outcome Make and analyze decisions, using expected gains and losses, based on the probabilities of simple events. **Specific Outcomes** 4. (P2–6) Connect probabilities to calculated expected gains or losses. [CN, PS, R, V]	4.1 You are designing a coin-tossing game to be used at the school penny carnival. Students pay 25 cents to toss three coins at the same time—a quarter, a dime and a nickel. They can keep those coins that turn up heads. a) Toss the three coins. In the second column of the chart below, record the coins with heads. b) Calculate the payout for the toss, and record the payout in the third column of the chart. c) Calculate the amount raised or lost for the toss, and record this in the fourth column. d) Repeat steps a) to c) until the chart is complete. The first two lines of the chart have been filled in already.

Results Chart

Toss Number	Coins with Heads	Payout on this Toss	Amount Raised or Lost on this Toss
1	quarter and dime	35 cents	10 cents lost
2	dime and nickel	15 cents	10 cents raised
3			
4			
5			
6			
7			
8			
9			
10			

e) Use your results from the chart to estimate the expected amount the carnival would raise if the game were played with 200 tosses.
f) Use your knowledge of probability to calculate—not predict—the average payout per toss for this game.
